## Phthalate Free Insect Screen

### Our contribution to a healthier environment

The purpose of insect screens is the creation of an environment in your home, being free from insects, by allowing a good air supply at same time.

In order to avoid any detraction of this goal due to the possible influence of questionable or even harmful plasticizers, our screen products have been adapted to today's and future environmental requirements.

The use of several plasticizers respectively phthalates which were inter alia contained in products such as toys, sport and leisure articles, electronic articles, automotive parts, technical medical components, or even materials for the construction industry, meanwhile has been highly restricted or even forbidden.

On this occasion  insect screens are produced phthalate free and have been successfully certified by an independent body in cooperation with a renowned laboratory. The certification is documented by the following official and protected logo:

This certification is valid for the period of 1 year only. After the expiry date, a recertification needs to be done.

*Further information on phthalates and their properties and effects, as well as their acceptance, partial restriction or prohibition in products, can be provided by different government agencies for health and environment, such as REACH for the EU, consumer organizations, and appropriate certification bodies. In many cases, this information is available online.*
